

A revolution in pipeline rehabilitation.

Ask us about Spiral Wound Pipe and DiaFit™ technology.

Features and Benefits of Spiral Wound Pipe

- › Non invasive pipeline rehabilitation
- › No risk of damage to other underground services
- › Reduce excavation & installation time
- › Significantly minimise the cost of rehabilitating ageing infrastructure
- › Dramatically improve pipeline lifespan
- › Responsive snug fit for pipes 150mm up to 1000mm
- › Compliance with ASNZS 2566:1 Compliance to flexible buried pipelines
- › Finished outcome is the same as a brand new pipe
- › SWP provides Flexibility to withstand ground movement

Ask us how you could potentially save weeks of labour and excavation costs, and prolong the life of aging pipeline infrastructure in a fraction of the time you'd expect.

Spiral Wound Pipe is the latest innovation in pipeline and culvert rehabilitation. Using DiaFit™ 'close fit' technology, a new profile is initially wound into the existing pipe at a smaller diameter, and expanded out to make a new pipe which is in close contact with the existing pipe.

Applications for Spiral Wound Pipe

- › **Wastewater mains:** Relining of wastewater mains from 150mm to 1000mm with no or minimal disruption to surrounding rehabilitation area.
- › **Stormwater:** Relining of stormwater mains from 150mm to 1000mm with limited disruption to the surrounding area. Ideal for road crossings and culvert rehabilitation.
- › **Rehabilitation of circular access chambers:** Rehabilitation of severely corroded circular access chambers without having to remove existing structure.
- › **Road culverts:** Relining of road culverts from 150mm to 1000mm with limited disruption to the surrounding area. Ideal for relining corrugated iron and concrete culverts.
